

ABSTRACT OF THE DISCLOSURE

Disclosed is a video and audio playing device. When play data of each disk in a disk selection unit is not stored in a non-volatile memory unit, a control unit controls a reading unit to read the play data of each disk, so as to store to a non-volatile memory unit. When a user chooses the disk to play by selecting from a navigating key, the control unit collects the play data of the disk stored in the non-volatile memory unit, and also stores to a volatile memory unit. Afterwards, when media contents of the disks are played, the control unit collects the play data stored in the volatile memory unit, and then displays the play data on a display unit.
